Chemoinformatics Approaches to Virtual Screening: RSC

Chemoinformatics Approaches to Virtual Screening: RSC

Chemoinformatics is broadly a scientific discipline encompassing the design, creation, organization, management, retrieval, analysis, dissemination, visualization and use of chemical information. It is distinct from other computational molecular modeling approaches in that it uses unique representations of chemical structures in the form of multiple chemical descriptors; has its own metrics for defining similarity and diversity of chemical compound libraries; and applies a wide array of statistical, data mining and machine learning techniques to very large collections of chemical compounds in order to establish robust relationships between chemical structure and its physical or biological properties. Chemoinformatics addresses a broad range of problems in chemistry and biology; however, the most commonly known applications of chemoinformatics approaches have been arguably in the area of drug discovery where chemoinformatics tools have played a central role in the analysis and interpretation of structure-property data collected by the means of modern high throughput screening. Early stages in modern drug discovery often involved screening small molecules for their effects on a selected protein target or a model of a biological pathway. In the past fifteen years, innovative technologies that enable rapid synthesis and high throughput screening of large libraries of compounds have been adopted in almost all major pharmaceutical and biotech companies. As a result, there has been a huge increase in the number of compounds available on a routine basis to quickly screen for novel drug candidates against new targets/pathways. In contrast, such technologies have rarely become available to the academic research community, thus limiting its ability to conduct large scale chemical genetics or chemical genomics research. However, the landscape of publicly available experimental data collection methods for chemoinformatics has changed dramatically in very recent years. The term "virtual screening" is commonly associated with methodologies that rely on the explicit knowledge of three-dimensional structure of the target protein to identify potential bioactive compounds. Traditional docking protocols and scoring functions rely on explicitly defined three dimensional coordinates and standard definitions of atom types of both receptors and ligands. Albeit reasonably accurate in many cases, conventional structure based virtual screening approaches are relatively computationally inefficient, which has precluded them from screening really large compound collections. Significant progress has been achieved over many years of research in developing many structure based virtual screening approaches. This book is the first monograph that summarizes innovative applications of efficient chemoinformatics approaches towards the goal of screening large chemical libraries. The focus on virtual screening expands chemoinformatics beyond its traditional boundaries as a synthetic and data-analytical area of research towards its recognition as a predictive and decision support scientific discipline. The approaches discussed by the contributors to the monograph rely on chemoinformatics concepts such as: -representation of molecules using multiple descriptors of chemical structures -advanced chemical similarity calculations in multidimensional descriptor spaces -the use of advanced machine learning and data mining approaches for building quantitative and predictive structure activity models -the use of chemoinformatics methodologies for the analysis of drug-likeness and property prediction -the emerging trend on combining chemoinformatics and bioinformatics concepts in structure based drug discovery The chapters of the book are organized in a logical flow that a typical chemoinformatics project would follow - from structure representation and comparison to data analysis and model building to applications of structure-property relationship models for hit identification and chemical library design. It opens with the overview of modern methods of compounds library design, followed by a chapter devoted to molecular similarity analysis. Four sections describe virtual screening based on the using of molecular fragments, 2D pharmacophores and 3D pharmacophores. Application of fuzzy pharmacophores for libraries design is the subject of the next chapter followed by a chapter dealing with QSAR studies based on local molecular parameters. Probabilistic approaches based on 2D descriptors in assessment of biological activities are also described with an

overview of the modern methods and software for ADME prediction. The book ends with a chapter describing the new approach of coding the receptor binding sites and their respective ligands in multidimensional chemical descriptor space that affords an interesting and efficient alternative to traditional docking and screening techniques. Ligand-based approaches, which are in the focus of this work, are more computationally efficient compared to structure-based virtual screening and there are very few books related to modern developments in this field. The focus on extending the experiences accumulated in traditional areas of chemoinformatics research such as Quantitative Structure Activity Relationships (QSAR) or chemical similarity searching towards virtual screening make the theme of this monograph essential reading for researchers in the area of computer-aided drug discovery. However, due to its generic data-analytical focus there will be a growing application of chemoinformatics approaches in multiple areas of chemical and biological research such as synthesis planning, nanotechnology, proteomics, physical and analytical chemistry and chemical genomics.

From reader reviews:

Ernie Swisher:

People live in this new morning of lifestyle always attempt to and must have the free time or they will get wide range of stress from both day to day life and work. So , if we ask do people have spare time, we will say absolutely yes. People is human not really a robot. Then we inquire again, what kind of activity do you have when the spare time coming to a person of course your answer may unlimited right. Then do you ever try this one, reading publications. It can be your alternative with spending your spare time, the particular book you have read is usually Chemoinformatics Approaches to Virtual Screening: RSC.

Jeff Wheeler:

Chemoinformatics Approaches to Virtual Screening: RSC can be one of your starter books that are good idea. All of us recommend that straight away because this e-book has good vocabulary that will increase your knowledge in vocab, easy to understand, bit entertaining but delivering the information. The writer giving his/her effort to get every word into pleasure arrangement in writing Chemoinformatics Approaches to Virtual Screening: RSC yet doesn't forget the main position, giving the reader the hottest and also based confirm resource information that maybe you can be considered one of it. This great information can certainly drawn you into brand new stage of crucial contemplating.

Paul Moore:

Reading a book to become new life style in this season; every people loves to learn a book. When you learn a book you can get a lots of benefit. When you read books, you can improve your knowledge, because book has a lot of information upon it. The information that you will get depend on what types of book that you have read. If you need to get information about your study, you can read education books, but if you want to entertain yourself read a fiction books, this kind of us novel, comics, along with soon. The Chemoinformatics Approaches to Virtual Screening: RSC provide you with new experience in reading through a book.

Ernie Fleishman:

Is it anyone who having spare time and then spend it whole day simply by watching television programs or just lying on the bed? Do you need something new? This Chemoinformatics Approaches to Virtual Screening: RSC can be the answer, oh how comes? A fresh book you know. You are therefore out of date, spending your spare time by reading in this completely new era is common not a geek activity. So what these books have than the others?
